1 What will be the output of the following code snippet?

def func(a, b): return b if a == 0 else
func(b % a, a) print(func(30, 75))

- a) 10
- **b)** 20
- c) 15
- **d**) **0**

Answer is C

2 numbers = (4, 7, 19, 2, 89, 45, 72, 22) sorted_numbers = sorted(numbers) even = lambda a: a % 2 == 0 even_numbers = filter(even, sorted_numbers) print(type(even_numbers))

- a) Int
- b) Filter
- c) List
- d) Tuple

Answer is B (Filter)

- 3) As what datatype are the *args stored, when passed into
- a) Tuple
- b) List
- c) Dictionary
- d) none

Question not clear

4)
$$set1 = \{14, 3, 55\}$$

$$set2 = \{82, 49, 62\}$$

```
set3 = {99,22,17}
```

print(len(set1 + set2 + set3))

a) 105

- b) 270
- c) 0
- d) Error

Answer none of the above, because the len function will return the length of each set and when added together they add up to 9

5) What keyword is used in Python

to raise exceptions? a) raise

- b) try
- c) goto
- d) except

Answer is B: try.

- **6)** Which of the following modules need to be imported to handle date time computations in Python?
- a) timedate
- b) date
- c) datetime
- d) time

Answer is C

7) What will be the output of the following code snippet?

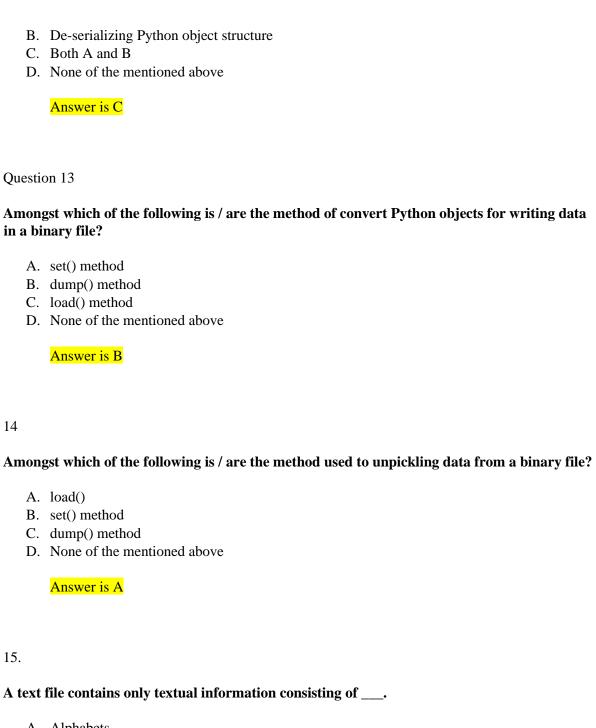

$$print(4**3 + (7 + 5)**(1 + 1))$$

- a) 248
- b) 169
- c) 208
- d) 233

Answer is C

- 8) Which of the following functions converts date to corresponding time in Python?
 - a) strptime

b) strftime
c) both a) and b)
d) None
Answer is C but I should also add both functions are used to format date string into the current or given date and time
9) The python tuple is in nature. a)
mutable
b) immutable c)unchangeable
d) none
Answer is B
10)
The is a built-in function that returns a range object that consists series of integer numbers, which we can iterate using a for loop.
A. range()B. set()C. dictionary{}D. None of the mentioned above
Answer is A
Question 11
Amongst which of the following is a function which does not have any name?
A. Del functionB. Show functionC. Lambda functionD. None of the mentioned above
Answer is C
Question 12
The module Pickle is used to
A. Serializing Python object structure

- A. Alphabets
- B. Numbers
- C. Special symbols
- D. All of the mentioned above

Answer is D

```
Which Python code could replace the ellipsis (...) below to get the following output? (Select all that
apply.)
captains = \{
  "Enterprise": "Picard",
  "Voyager": "Janeway",
  "Defiant": "Sisko",
}
    Enterprise Picard,
    Voyager Janeway
    Defiant Sisko
            a) for ship, captain in captains.items():
              print(ship, captain)
            b) for ship in captains:
              print(ship, captains[ship])
            c) for ship in captains:
              print(ship, captains)
            d) both a and b
                Answer is A
17)
Which of the following lines of code will create an empty dictionary named captains?
    a) captains = {dict}
    b) type(captains)
    c) captains.dict()
    d) captains = {}
```

Answer is D

18) Now you have your empty dictionary named captains. It's time to add some data!

Specifically, you want to add the key-value pairs "Enterprise": "Picard", "Voyager": "Janeway", and "Defiant": "Sisko".

Which of the following code snippets will successfully add these key-value pairs to the existing captains dictionary?

```
a) captains{"Enterprise" = "Picard"} captains{"Voyager" = "Janeway"} captains{"Defiant" = "Sisko"}
b) captains["Enterprise"] = "Picard" captains["Voyager"] = "Janeway" captains["Defiant"] = "Sisko"
c) captains = {
    "Enterprise": "Picard",
    "Voyager": "Janeway",
    "Defiant": "Sisko",
}
d) None of the above
```

Answer is B

19) You're really building out the Federation Starfleet now! Here's what you have: captains = {

```
"Enterprise": "Picard",

"Voyager": "Janeway",

"Defiant": "Sisko",

"Discovery": "unknown",
```

Now, say you want to display the ship and captain names contained in the dictionary, but you also want to provide some additional context. How could you do it?

```
a) for item in captains.items():
    print(f"The [ship] is captained by [captain].")
b) for ship, captain in captains.items():
    print(f"The {ship} is captained by {captain}.")
c) for captain, ship in captains.items():
    print(f"The {ship} is captained by {captain}.")
d) All are correct
    Answer is B
```

20)

You've created a dictionary, added data, checked for the existence of keys, and iterated over it with a for loop. Now you're ready to delete a key from this dictionary:

```
captains = {
    "Enterprise": "Picard",
    "Voyager": "Janeway",
    "Defiant": "Sisko",
    "Discovery": "unknown",
}
```

What statement will remove the entry for the key "Discovery"?

- a) del captains
- b) captains.remove()
- c) del captains["Discovery"]
- d) captains["Discovery"].pop()

Answer is C
